Activity 3: Stakeholder + AI-Ethics Map

Student: Assel Saginayeva
Company B: Bayan Sulu
Company A: Ferrero
AI use case: AI-driven demand forecasting and inventory/distribution management

Stakeholder Who is affected	**What they want / risk** What do they want, and what could they risk?	**AI or business issue** What AI or business issue affects them?	**Company B obligation** Company B do to protect or support them?	**Company A evidence** How does Company A handle a similar issue? What evidence did you find?	**Transfer verdict** Should Company B use Company A's practice? Why?
Example:Customers	Fast, fair, safe service	AI customer decisions	Privacy + human review	How company A handles it	ADAPT / PILOT
Customers	Fresh, affordable sweets that are actually in stock — if the AI gets the forecast wrong, shelves either sit with stale candy or run empty, leads to shortage	AI demand forecasting sets store-level supply and shelf freshness	Set expiry/freshness thresholds the AI must respect; audit forecast accuracy regularly	Ferrero's Alloy.ai pilot targeted reducing overstocks	PILOT
Employees	Want job security and clear tasks; risk being blamed for AI mistakes or losing their job	AI decides packing/shipping order based on forecasts, not staff judgment	Require human sign-off before AI decisions take effect; retrain staff to work with the system	Ferrero uses Alloy.ai to give staff full visibility across the supply chain — the AI just provides insight, humans still make the decisions.	ADAPT

Stakeholder Who is affected	**What they want / risk** What do they want, and what could they risk?	**AI or business issue** What AI or business issue affects them?	**Company B obligation** Company B do to protect or support them?	**Company A evidence** How does Company A handle a similar issue? What evidence did you find?	**Transfer verdict** Should Company B use Company A's practice? Why?
Suppliers	Predictable order volumes to plan their own production; risk being caught off guard by sudden order changes from the AI.	The AI's demand forecast decides how much raw material gets ordered	Share forecast ranges with key suppliers; give notice before large swings	Ferrero's AI system focuses on understanding demand and working more closely with supply partners.	ADAPT

Task: Choose one AI use case in your Company B. Look at the same decision from the perspective of four different stakeholders. Identify what each stakeholder needs, what could go wrong, and what Company B should do. Then compare it with Company A and decide whether that practice should transfer to Company B.
