Artifact: Stakeholder and AI-Ethics Map — Bayan Sulu and Ferrero

This artifact uses two simple ideas together. A *stakeholder map* shows the different groups a company affects — customers, employees, suppliers, investors, regulators, and the environment. An *AI-ethics lens* then looks at each group and asks: what could go wrong, or what should the company be careful about, if it uses AI here? Bayan Sulu is a Kazakhstan company that sells to 14 countries and mostly uses automation to help make and check its products [1]. Ferrero is a much bigger, family-owned company that sells in over 170 countries and uses AI in more parts of its business, such as predicting demand and checking its supply chain [2].

Customers / Consumers — *main issue: privacy and honesty.* Bayan Sulu does not use much AI directly with customers; most of its automation is in the factory, for making and checking products [1]. If it starts using AI to predict demand, it should make sure this does not change prices or labels in a way that misleads customers. Ferrero interacts with customers more directly, through online shopping, loyalty programs, and AI tools that predict demand, such as the Alloy.ai system used by its U.S. team [3]. Because Ferrero collects more customer data, it has a bigger responsibility to protect that data.

Employees — *main issue: fairness and human oversight.* Bayan Sulu's automated machines affect jobs at one factory, so the company should help retrain or move workers as more tasks become automated. Ferrero uses automation and AI in many more factories and supply-chain jobs around the world [2]. Because the effect is bigger, Ferrero needs stronger, more consistent training programs, and must make sure that if it ever uses AI to help with hiring or reviewing employees, the AI treats workers fairly no matter which country they are in.

Suppliers / Producers — *main issue: accountability.* Bayan Sulu mainly buys from local and regional suppliers. If it starts using AI to predict how much it needs to order, it should avoid sudden changes that could hurt small suppliers. Ferrero buys ingredients like palm oil, cocoa, and hazelnuts from all over the world. It uses a satellite-based AI tool called "Starling," built with the Earthworm Foundation and Airbus, to check whether its palm oil suppliers are cutting down forests [4]. This is a good example of AI helping with ethics — but only if Ferrero actually acts on what the AI finds, not just collects the data.

Investors / Shareholders — *main issue: openness.* Bayan Sulu is listed on the Kazakhstan Stock Exchange, so it must follow normal rules about telling investors what it is doing, including any AI projects [1]. Ferrero is privately owned by the Ferrero family, not publicly traded [5]. This means Ferrero can choose how much it tells the public about its AI use and risks. Bayan Sulu's investors get more automatic information; Ferrero's openness depends on the company's own choice.

Regulators / Government — *main issue: following the rules in each country.* Bayan Sulu only has to follow Kazakhstan's food-safety and stock-market rules. Ferrero sells in more than 170 countries, so it must follow many different rules at once [2], including new AI rules like the European Union's AI Act. An AI tool that is fine in one country might not meet the rules in another, so Ferrero has a much bigger job keeping track of this.

Environment / Local Communities — *main issue: using AI to help the environment.* Bayan Sulu's environmental impact is local, tied to its one factory in Kazakhstan. Ferrero's impact is global, and it uses AI and satellite monitoring to watch for deforestation in its palm-oil supply chain [4]. This shows that AI can do more than create risk — it can also be a tool that helps protect the environment. But bigger companies like Ferrero also carry more responsibility, because they can cause more harm if they do not act on what the AI shows them, and they also have more resources to invest in this kind of monitoring

Recommendations for Bayan Sulu on AI Ethics

Based on the stakeholder map above, here are practical steps Bayan Sulu could take now, while its use of AI is still small, so that ethical safeguards grow alongside the technology rather than being added after a problem happens.

Protect small suppliers from sudden changes: If Bayan Sulu uses AI to forecast how much it needs to order, it should give local suppliers advance notice of demand changes rather than sudden ones, so that small regional suppliers are not hurt by AI-driven decisions they cannot predict.

Plan for the effect on workers early: As more factory tasks become automated, Bayan Sulu should offer training programs so employees can move into new roles instead of losing their jobs. Planning this before automation expands is easier than reacting to job losses afterward.

Set clear rules for data before AI use grows: Bayan Sulu should decide now how any customer or business data used by AI will be stored and protected, even while its AI use is still limited. This is much easier to do early than to fix later, once far more data is involved.

Borrow Ferrero's supply-chain idea, at a smaller scale: Ferrero uses satellite-based AI monitoring to check whether its palm-oil suppliers are causing deforestation [4]. Bayan Sulu could use a simpler version of this idea — basic data tools to check that its own suppliers meet quality and fair-labor standards — instead of relying only on trust.

Write a short, plain AI-ethics policy: A written policy would help — for example, stating that no AI decision is made without a person checking it, and that customer data is never used by AI without customers being told. A simple written policy like this would put Bayan Sulu ahead of many similarly sized companies and would make future growth in AI use much easier.
