AI Business Model Stress Test

Element	Company B now	AI opportunity / change	Risk / VUCA pressure	Company A evidence	Verdict + why
Customer / need	Families who want tasty sweets at a fair price. About half of sales are in Kazakhstan and half in other countries. 126 products are halal.	Use AI to study sales data and see which products sell best in each region and country. Track halal products and export sales separately to see where demand is growing.	**Uncertainty:** Most exports go to one country, Russia. If rules or borders change, sales can drop quickly.	Ferrero USA used an AI tool (Alloy.ai) to put all its sales and stock data in one place, so every team sees the same picture.	**ADAPT** – Bayan Sulu has the same goal, but first it must ask shops and online stores like Kaspi to share their sales data.
Value propositio n	A trusted "Made in Kazakhstan" brand with good quality at a low price. Over 350 products. Sponsors national sports teams.	Use AI to design special packaging, for example with Kazakh patterns or national team themes, for limited editions.	**Ambiguity:** We don't know if people will pay more for new packaging. Designs could get the culture wrong. Special printing costs money.	Nutella used a computer program to make 7 million jars with different designs. They all sold out in one month.	**PILOT** – a good fit for a national brand, but Bayan Sulu's products are cheap, so extra costs may not pay off. Test one small series first.
Delivery / process	Several factory workshops plus a big new biscuit factory (16,600 tonnes a year). Products reach buyers through wholesalers, supermarkets and export.	Use AI to predict how much will sell and plan production to match. AI can also warn before machines break and track trucks with exports.	**Volatility:** Sugar and cocoa prices jump up and down. Border delays happen. With the new factory, making too much means biscuits may expire before they are sold.	Ferrero uses AI tools to track its deliveries and to avoid empty shelves and expired stock.	**ADOPT** – Bayan Sulu has exactly the same problem, and it is urgent: the new factory's products must be sold, not stored. The tools already work, and results are easy to measure.
Resources / activities	Has its own packaging workshop and spends 1.5–2 billion tenge a year on new machines.	Use AI to watch for problems with suppliers and ingredients. Train staff in data and AI. Later, track where	**Complexity:** Tracking ingredients needs help from suppliers and data that Bayan	Ferrero uses satellites to know which farm 98% of its cocoa comes from.	**DELAY** – this matters mostly for selling in Europe, but Bayan Sulu sells mainly to nearby countries and China. Build staff skills first and

	Buys cocoa through traders. Few staff have data or AI skills.	ingredients come from.	Sulu does not control. Staff lack the skills.		return to this later.
Revenue / value capture	Earns money by selling large amounts at small profit per item. Needs to pay back a 20 billion tenge factory. Has not paid shareholders dividends for two years.	Use AI to choose better prices and discounts with shops. Less waste and fewer returns mean more profit.	**Volatility and competition:** Strong rivals like imported brands and Rakhat. Big shops have power over prices. Customers care a lot about price.	Ferrero's AI test in the USA showed it could raise profit by 5% or more a year.	**PILOT** – more profit is attractive, but wrong prices could upset shops. Try it first with one supermarket chain or on Kaspi and compare results.
