Weekly Record — Week 4

Sep 29, 2026 · @Assel Saginayeva

Field 1 · Concept

Key terms from Chapters 6 and 7 [1]:

- **Management** – reaching goals by planning, organizing, leading and controlling people and resources.
- **Efficiency and effectiveness** – efficiency means doing work with little waste; effectiveness means doing the right work.
- **Management pyramid** – top managers make long-term plans, middle managers turn them into yearly plans, and supervisors run the daily work.
- **Control process** – set a goal, measure the results, compare them with the goal, and fix any problems.
- **Line and staff** – line managers give orders; staff experts only give advice.
- **Centralized and decentralized** – decisions are made at the top, or they are spread down to lower managers.

Concept Check: How can technology help managers make decisions?

Technology gives managers faster and better information. It helps them spot problems early. But technology only helps with the information. A person still has to make the choice and take responsibility for it. So AI can make decisions faster, but a human must decide whether they are right.

Field 2 · Application

My artifact: a "who decides" table for Bayan Sulu (Company B).

Bayan Sulu is a sweets maker in Kostanay, Kazakhstan. It has about 1,500 workers and makes more than 300 products [2]. In 2026 it announced a new factory that will add 260 jobs and raise output to 100,000 tons a year [3]. My table shows where AI could help at each level of the pyramid, who still makes the final call, and which of four human–AI modes fits each decision.

Level	Decision	What AI does	Who decides	How we check	Human–AI mode
Top	Growth and export plans	Suggests possible scenarios	CEO and board	Review every 3 months	Human + AI
Middle	Weekly production plan	Predicts demand for each product	Planning manager	Compare the forecast with real orders	Human + AI

Level	Decision	What AI does	Who decides	How we check	Human–AI mode
Supervisor	Pass or reject a batch of sweets	A camera spots defects	Shift supervisor checks every reject	Food-safety records	AI Executes with Human Review
HR	Hiring 260 new workers	Books interviews, answers questions	HR manager	AI never rejects anyone	Human Only
Export	Export paperwork	Fills in routine forms on its own	Export specialist sets the rules	Spot-check 10 files a month	Automated

The four human–AI modes in my table:

- **Human Only** – people do the task and make the decision. In hiring, AI only books interviews and answers questions; it never judges applicants.
- **Human + AI** – AI gives ideas or forecasts, and a person makes the choice. Used for growth plans and the weekly production plan.
- **AI Executes with Human Review** – AI does the task, and a person checks the result before it counts. The camera rejects faulty sweets, and a supervisor checks every reject.
- **Automated** – AI does the task by itself, and people set the rules and check samples afterwards. Used only for routine export forms, with 10 files checked each month.

Field 3 · Verification and AI

What I checked:

- **Company facts** (workers, products, exports) – checked on Bayan Sulu's page on the KazFoodProducts website [2]. They matched.
- **New factory** (260 jobs, 100,000 tons) – checked in the company's June 2026 press release [3]. I updated the output number from 85,000 to 100,000 tons.
- **Automation or augmentation** – checked in a research article by Raisch and Krakowski [4]. Automation means AI does the job alone; augmentation means AI helps a person do it.
- **Human control of AI** – checked in the NIST AI Risk Management Framework [5]. This is why every row in my table has a named person in charge.

AI system used: Claude, made by Anthropic. I used it to connect the chapter ideas to Bayan Sulu and to draft the table. I then checked every number and source myself.

Field 4 · Transfer

My advice: Bayan Sulu should use AI as an adviser, not as a boss. Managers keep the power to decide.

Choice	What	Why
Adopt	Demand forecasting for production planning	Low risk and saves time; the manager still decides
Adapt	A small AI team that advises managers	Adds new skills without confusing who the boss is
Pilot	Camera quality checks on one line of the new factory	Easy to test on new machines; a supervisor still checks
Delay	AI that sets export prices	About 45% of products are exported [2], and the data is not ready yet
Reject	AI that rejects job applicants on its own	Hiring is about people; mistakes would hurt trust and fairness

To track results, the company can use the balanced scorecard from Chapter 6. It measures four areas: money, customers, work processes, and learning. Each AI tool should show good results in these areas before it is used more widely.

Field 5 · Evidence

New sources this week: [3], [4] and [5].

Field 6 · Capstone link

This record will grow into **Capstone Section 4: Human–AI operating model**. An operating model explains how work gets done: who makes decisions, which tools help, and how results are checked. My "who decides" table will become the main exhibit, showing where AI can help Bayan Sulu at each level and which person has the final say.

In my Capstone, I will explain that Bayan Sulu should create a small AI team that gives advice to managers. I will use the balanced scorecard to check if the camera test works. I will also say that the new factory must follow strict food-safety rules, and every AI tool must be tested on one line before the whole factory uses it.
